

AMENDMENTS TO THE SPECIFICATION

Please amend paragraph [0012] as follows:

Secondly, a value of vbv_delay (accumulation quantity of a virtual input buffer of decoder) within the picture header is re-recorded as '0xFFFF'. This value is a code indicating a null of the vbv_delay. In doing so, the re-recording is carried out because a wrong result is brought about in case of using an original value of the vbv_delay is used as it is, since the picture sequence is varied from an original one on ~~tick~~trick play.

Please amend paragraph [0029] as follows:

In a further aspect of the present invention, a playback method in a digital video record/playback apparatus includes a step (a) of storing transport packets of a selected program, picture information, and PCR (program clock reference)~~program clock reference~~ of the selected program, a step (b) of performing STC (system time clock) count initialization using a value of the stored PCR and incrementing or decrementing an STC count according to a direction of a trick play mode, a step (c) of adjusting DTS (decoding timestamp) of a picture to be decoded according to the direction and multiple-times speed of the trick play mode, and a step (d) of decoding to output picture data of the selected program by controlling a decoding time point by comparing a value of the adjusted DTS to a value of the incremented or decremented STC count and by referring to the picture information according to the trick play mode.
